

Connectivity to Sea Run Fish
Common Ground Fair
Unity, Maine
September 20-22, 2013

The Atlantic Salmon Program was at the Environmental Concerns tent at MOFGA's Common Ground Country Fair September 20-22, 2013. Volunteers from NOAA and USFWS illustrated the importance of connectivity to sea run fish. They demonstrated fundamental stream functions in relation to stream barriers by running a hands on demonstration using a model stream table.

This was a major success with several hundred students, along with their teachers, and many families dropping by the booth to see our display. The hands on part of the display was excitedly received by the many students and adults alike. Many questions were asked and the students took notes for a report they would have to do later on for their class. We received tons of comments from folks that they had thought the model stream table was an awesome idea and helped to make our presentation much clearer and fun for all.
